

FERTIGATION BENEFITS

Cost Savings

Usually when factors such as labor, fuel, and interrupted play are factored into traditional fertilizer applications, significant cost savings can be seen from use of fertigation techniques. Additionally, using fertigation, you can usually get the same results from using inexpensive liquids as you can from expensive time release granular fertilizers.

Consistent Nutrient Levels

Feeding low levels of nutrition continuously as opposed to intermittent applications provides improved turf consistency.

Reduced Labor

Fertigation reduces the amount of labor required to apply granular fertilizers or sprayed out foliars.

Less Interference with Play

The application of granulars and foliars and the irrigation that usually follows such applications can interrupt play on busy golf courses. Fertigation occurs with your nightly irrigation, alleviating this problem.
