

WATCHER 2.0

Control Software

General Description

The Watcher™ Control and Monitoring software package, is the latest accessory for our popular Green Scorpion™ system control package. It allows you to monitor and control your water treatment system from a remote location.

On the monitoring side, you can see all of the available screens on your Green Scorpion™ system in real time. Additionally, you can view some additional information that is recorded in the Green Scorpion™ that can't be accessed from the main keypad, such as: 12 hour flow graphs, 30 day water usage graph, and a last hour pH graph (if you have pH control).

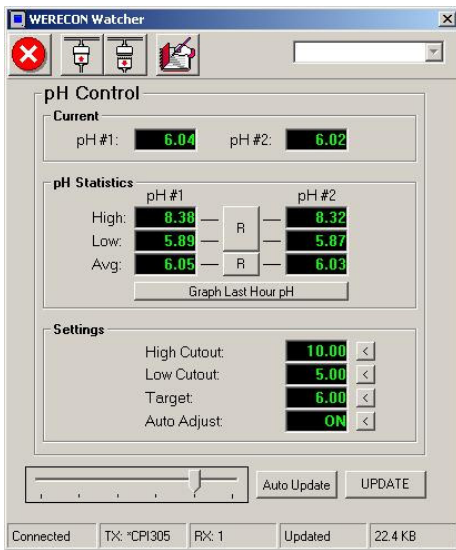

On the control side, you can do virtually anything from the Watcher™ software that you could do from the keypad, including: rate setting, master on/off, set time and date information, reset tank levels, etc.

Our competitors often make you buy special expensive controllers for the system in order to provide data connectivity. This is because their controls are usually made of a collection of off-the-shelf parts. The beauty of our system, lies in the Green Scorpion™ itself. It was built from the ground up by WERECON, and has had data communications capability all along. The Green Scorpion™ / Watcher™ system supports many different communications options, most of them wireless. Odds are, if you have a Green Scorpion™ control system, and your pump station is not on the moon, we can find an economical communications solution for you.

Watcher Features & Screens

- Easy to use display screens function just like the Green Scorpion™ itself. Minimizes learning curve.
- pH control screen (left) shows statistical and current pH information, as well as Auto Adjust settings.
- Product screen (right) allows you to set and view all current product settings.
- Slider bar on bottom functions like screen control (arrow) keys on Green Scorpion™

- Water graphs (left and right) allow you to view long term information about water usage.
- Information is based on real sensor data from the pump station. Not theoretical values as are calculated by most irrigation control systems.

- The pH graph (left) allows you to view the performance of your pH control system on a minute-by-minute basis for the last hour of operation.
- Depending on your communications setup, it is possible for a WERECON technician to view your system to help you with questions or problems.
- With wireless internet connectivity, you can use the system from your home, office, or even car.
